TITLE : PRODUCTION OF THERMOPLASTIC
POLYESTER RESIN FOAM

熱可塑性ポリエステル系樹脂の I. V. 値

ABSTRACT : PROBLEM TO BE SOLVED: To improve the low temperature shock resistance of a thermoplastic polyester resin, while the characteristics of the resin is maintained as such.

SOLUTION: This method for producing a thermoplastic polyester resin foam comprises adding a polycarbonate resin to a thermoplastic polyester resin having an I.V. value of 0.6-1.3 in an amount ranging from $[(a)-0.25 \times (\text{the I.V. value of the thermoplastic polyester resin})] \times 100 \text{ wt.}\%$ [(a) is 0.33-0.35] to 50 wt. %, further adding a foaming agent, melt-blending the resin composition, and subsequently extruding the melted resin composition into a low temperature zone. The obtained thermoplastic polyester resin foam has a density of $\leq 0.7 \text{ g/cc}$.

AB - JP11140210 A method for manufacturing a foamed body of a thermoplastic polyester resin comprises adding a polycarbonate resin in an amount of at least (a $-0.25 \times \text{I.V. of the thermoplastic polyester resin}$) $\times 100$ wt.% to upto 50 wt%. and a foaming agent to the thermoplastic polyester having I.V. of 0.6-1.3, melt blending the resin mixture and then discharging to a low pressure environment to form a foamed thermoplastic polyester having a density of up to 0.7 g/cc.

- Also claimed is that the thermoplastic polyester is polyethylene terephthalate.

- USE - The foamed body of a thermoplastic polyester resin is used as heat resistant food container.

- ADVANTAGE - The foamed body of the thermoplastic resin has heat resistance and also a low temperature impact resistance.
